

Placing the Fans

“Design is not just what it looks like and feels like. Design is how it works.” Steve Jobs

For the fans to be most effective, they should generally be evenly spaced throughout the facility—accounting for such things as varying ceiling heights—and have a “clear shot” to the floor. As with any other HVAC installation, the individual characteristics of your site will dictate your lay-out. Just some of these include: the proximity and use of exterior doors (passage, dock-bay, garage and hangar, to name a few); existing HVAC & R equipment such as heaters, diffusers for heating and A/C, duct sox, freezer cases (dead-chest and display); floor-to-ceiling racks and overhead obstructions.

ZOO Fans are extremely versatile and can be installed as close as 12” to side-walls and ceilings and it’s simple to direct the airflow during installation. They can be hung from the Gripples provided—please take a few minutes to read through the installation instructions to see the basic installation—or they can easily be hung from 3/8” all-thread down rod—the preferred approach where the plan is to angle them.

Given the many different applications for ZOO Fans, you’ll no-doubt encounter situations that raise additional questions when preparing your ZOO Fan quotations. Simply give us a call – we welcome the opportunity to talk to you!
